

Composer.lock Audit Report

UUID: 129fd689-c49f-4e26-8df1-c672dba87ec9

Generated: 2025-12-09 17:59:26

Total packages 634	What it means: Total dependencies found in composer.lock. Why it matters: Baseline to understand your project scope. What you should consider: Use issue filters to focus on risk areas.
Version gap detected 47	What it means: A newer stable version of this package is available. Your project is currently using an older version. Why it matters: Older versions often miss important fixes, improvements, and occasional security-related updates. Over time, many version gaps can create upgrade difficulties and increase maintenance cost. What you should consider: Review the changelog and plan an update when it is safe for your project.
No release >24m 7	What it means: This package has not published any new release for more than two years. Why it matters: A long period without updates usually means the project is no longer actively maintained. Unmaintained packages are more likely to contain undetected bugs or outdated code that may become incompatible with future Magento or PHP versions. What you should consider: Monitor this package closely and consider finding alternatives if it becomes a long-term dependency.
Vulnerable packages 2	What it means: This package version is affected by a known security vulnerability confirmed by an official CVE. Why it matters: If the vulnerable code can be reached inside your Magento application, attackers may be able to exploit it. This could lead to security issues such as information leakage, privilege escalation, or other unwanted behavior. What you should consider: Updating to the fixed version is strongly recommended. If an update is not possible, review exposure and consider temporary mitigation.
Risky forks 1	What it means: Your project depends on a forked version of a package, or a custom version that is not actively maintained by the original vendor. Why it matters: Forks often miss security patches and may fall behind official updates. They can create unexpected upgrade problems and increase supply-chain risk because they do not follow standard release and review processes. What you should consider: Evaluate whether the fork is still needed. If possible, migrate back to the official package or a well-maintained alternative.

Abandoned 10

What it means: The package has been marked as “abandoned” on Packagist. The vendor officially states it will no longer maintain this project.

Why it matters: Abandoned packages do not receive bug fixes, compatibility updates, or security patches. Over time, this increases the risk of vulnerabilities and makes your project harder to maintain or upgrade.

What you should consider: Plan to replace this package or remove it from your dependency tree. Long-term reliance on abandoned software is not recommended.

Archived 7

What it means: The GitHub repository for this package has been archived.

Why it matters: An archived repository is effectively “frozen.” No future changes, fixes, or security updates will be provided. This signals the project has reached end-of-life.

What you should consider: Treat archived packages similar to abandoned ones and review whether a maintained alternative exists.

Yanked 0

What it means: This specific version of the package was withdrawn (yanked) by the maintainer.

Why it matters: A version is typically yanked when it contains serious bugs, regressions, or potential security issues. Continuing to use a yanked version may expose your project to problems the vendor has already acknowledged.

What you should consider: Upgrade to a non-yanked version as soon as possible, even if the change seems small.
